Large peptic ulcers affecting the cardiac chambers are unusual but at least 11 cases have been recorded. Penetration of the pericardium or great vessels is less rare; Prolla et al. found 22 such cases and more recent examples have been reported by Monro et al. and by Caspi et al. Penetration of a coronary artery was reported by Matthews. Given that there may be many similar cases which are never reported it seemed worth reviewing the main features of peptic ulceration affecting the myocardium and describing another case.

Case report

The patient was an 81-year-old blind woman who lived in reduced circumstances. One week before her death she had fallen and lacerated her scalp. Her general practitioner then found that her haemoglobin concentration was only 5·3 g/dl, with a red cell count of \( 2·47 \times 10^{12}/l \). The mean cell haemoglobin concentration was 30·6 g/dl. The white cell count was \( 14·9 \times 10^9/l \), with \( 12·97 \times 10^9/l \) polymorphonuclear leucocytes and \( 1·05 \times 10^9/l \) lymphocytes. The blood film showed changes of iron deficiency. Because of these findings and her neglected state she was admitted to hospital. Her only specific complaint was of feeling faint and dizzy.

On examination she was pale and cold, with a temperature of 33·6°C, and showed signs of neglect. There were crepitations at the lung bases. The pulse was regular at 80 beats/min and the blood pressure was 100/40 mm Hg. There was no evidence of cardiac failure and the only important finding was the presence of black faeces in the rectum. No abnormality was reported in a supine chest radiograph.

She was regarded as having bronchopneumonia associated with chronic blood loss, hypothermia, and neglect. Despite supportive treatment she died eight hours after admission.

Necropsy was carried out nine hours after death. There was slight ankle oedema but no koilonychia. No important abnormality was found in the head or neck. There were small bilateral pleural effusions. There was a little pulmonary oedema but no evidence of infection or embolism.

Death was due to massive gastrointestinal haemorrhage. The stomach contained fresh blood and altered blood was present throughout the bowel. Otherwise the intra-abdominal organs were unremarkable.

The source of the bleeding was a large peptic ulcer 3 cm in diameter in the anterior wall of the stomach in a large sliding hiatal hernia about 7 cm in diameter. The ulcer had penetrated the pericardium and the pericardial cavity was obliterated by adhesions. The ulcer had invaded the myocardium of the left ventricle high up on the inferior surface (fig 1). The floor of the ulcer was in the form of a shallow cone, at the apex of which there was a small perforation into the ventricle (fig 2). The general form of the ulcer was typical of peptic ulceration and there was no evidence of tumour. Histological examination confirmed that the ulcer was benign and that it had arisen in gastric mucosa in the hiatal hernia. The surrounding mucosa appeared healthy, with a well-developed layer of parietal

Peptic ulceration affecting the left ventricle

The site of perforation of the heart has usually been the left ventricle but the left atrium may be affected. In the case described by Prolla et al the patient had received deep x-ray treatment. Other major vascular sites to be affected in the thorax include the coronary arteries, the aorta, and the pulmonary artery.

Most patients have died of massive gastrointestinal haemorrhage but in one case in which the left atrium was affected there was the bizarre feature of systemic food embolism. Matthews operated successfully on the patient whose coronary artery was affected but the patient died five days later from ventricular fibrillation. Macarthur operated successfully on an oesophagogastric fistula, but curative surgery was not attempted in the remaining cases.

I am indebted to Dr H Pilling, HM Coroner, for permission to publish this case. The photography is the work of the Department of Medical Illustration, Northern General Hospital, and Mrs Linda Norcliffe typed the manuscript.
