

KAPITEX

Excellence in Airway Management

BIVONA FOME CUF TRACHEOSTOMY TUBE

The problems of long term and permanent use of tracheostomy tubes are widely recognised.

The Kapitex range of tracheostomy tubes – together with a comprehensive care package including filters, dressings, accessories, humidification and suction – has been carefully selected to help prevent tracheal problems and obviate patient discomfort.

The Bivona Fome Cuf Tracheostomy tube is unique. It has many benefits which are vital for the safety of the patient, in long term tracheostomy use, particularly where mechanical ventilation is administered.

Unlike normal cuffed tracheostomy tubes Fome Cuf automatically inflates the cuff and seals the trachea, maintains cuff inflation, and automatically adjusts intercuff pressure to make it equal to the changing airway pressure, and importantly you cannot over-inflate the cuff.

With its range of safety features Bivona Fome Cuf is particularly suitable in intensive care and anaesthesia departments.

Bivona Fome Cuf has many significant features which make it uniquely suitable for long term tracheostomy use.

Send for our Tracheostomy products brochure for more information.

BIVONA ENDOTRACHEAL TUBES

The Fome Cuf range of silicone endotracheal tubes have been designed to overcome the problems of long term intubation.

It has many safety features which enhance its use over normal high volume low pressure cuffs.

The Fome Cuf endotracheal tubes will help prevent mucosal ischemic injury – and are ideally suited for long term intubation.

Our Tracheostomy Products brochure has full details of this important product, send for your copy.

ENDOXANE – A DEDICATED TRACHEOBRONCHIAL STENT

The Endoxane tracheobronchial stent system is used in the treatment of external compression of the main airway. Endoxane stents allow the practitioner to keep open the large airways – by a relatively simple method of application via bronchoscopy.

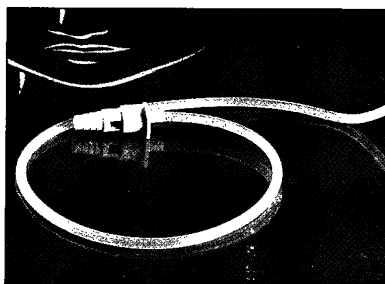

The Stents are made from moulded silicone – this material lends itself well for its indwelling function. The outside of the stent bears regularly placed studs – this maintains the position of the stent and helps prevent migration – a feature which may cause complications with other products not specifically designed for this use.

Endoxane gives immediate relief of respiratory symptoms and enhances quality of survival of the patient. Experience has shown that chemotherapy and radiation treatment can continue, and be more effective.

BOSTON MEDICAL

The Boston Medical range of Montgomery Cannula and Safe-T-Tube systems are clearly the best option in speciality ENT products.

We can supply comprehensive details of these systems – simply return the coupon today.

BRONCHITRAC L

– a unique suction tube – automatically enters the left Bronchus every time.

This simple device is inserted through a correctly positioned ET or Tracheostomy Tube.

No need to twist the Catheter or turn the patient.

The patented curvature assures consistent entry into the left main stem bronchus.

Ideal for suction of post cardiac/pulmonary patients. This time saved and the reduced trauma to the patient make this special suction catheter the obvious choice for those difficult, left bronchial suctionings.

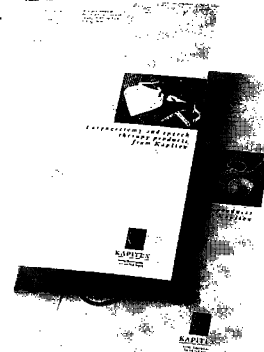

Kapitex are committed to excellence in head and neck surgery.

Our products are designed for surgical efficiency and dedicated to patient comfort and ease of use.

The problems of long term and permanent use of tracheostomy tubes, for example, have been addressed through intensive product development and exhaustive clinical trials.

This approach, and the resulting products, positions Kapitex as a leading name in this critical field.

If you would like more information on Kapitex products for long-term airway management, call Kapitex on 0937 580211, or simply return the coupon today.
