Editor, *British Medical Journal*

Notice to contributors

SUBMISSION AND PRESENTATION The original typescript and three copies of all papers should be sent to the Executive Editors, *Thorax* Editorial Office, Division of Respiratory Medicine, City Hospital, Nottingham NG5 1PB, UK. Editorial and historical articles are normally commissioned but the Editors may accept uncommissioned articles of this type. Manuscripts must be accompanied by a declaration, signed by all authors, that the paper is not under consideration by any other journal at the same time and that it has not been accepted for publication elsewhere. The typescript should bear the name and address of the author who will deal with editorial correspondence, and also a fax number if possible. Authors may be asked to supply copies of similar material they have published previously. If requested, authors shall produce the data upon which the manuscript is based for examination by the Editors. Papers are accepted on the understanding that they may undergo editorial revision. In the event of rejection one copy of the text may be retained for future reference. **Authors are asked to supply the name and address of a possible referee for their work.**

Papers must be typed in double spacing with wide margins for correction and on one side of the paper only. They should include a structured abstract on a separate sheet (see below). Full papers should follow the basic structure of abstract, introduction, methods, results, discussion, references, and tables and figures as appropriate. They should not normally exceed 3000 words or include more than 30 references; priority will be given to papers that are concise. In each issue of the journal we will publish a small number of Rapid Communications, intended for reports of work of major importance in any areas of research, which will undergo an accelerated reviewing and publication process. Rapid Communications must not exceed 2000 words, 15 references, and two figures or tables. Short reports of experimental work, new methods or a preliminary report can be accepted as two page papers and should comprise no more than 1300 words including a structured abstract, one table or illustration, and a maximum of 10 references. Case reports should not exceed 850 words with one table or illustration, a short unstructured abstract, and 10 references.

ABSTRACT Abstracts, which should be of no more than 250 words, should state clearly why the study was done, how it was carried out (including number and brief details of subjects, drug doses, and experimental design), results, and main conclusions. They should be structured to go under the headings "Background", "Methods", "Results", and "Conclusions".

KEYWORDS Authors should include on the manuscript up to three key words or phrases suitable for use in an index.

STATISTICAL METHODS The Editors recommend that authors refer to Altman DG, Gore SM, Gardner MJ, Pocock SJ. Statistical guidelines for contributors to medical journals. *BMJ* 1983;286:1489-93. Authors should name any statistical methods used and give details of randomisation procedures. 95% confidence intervals should be quoted for main results given as means or medians. The power of the study to detect a significant difference should be given when appropriate and may be requested by referees. Standard deviation (SD) and standard error (SE) should be given in parenthesis (not preceded by \pm) and identified by SD or SE at the first mention.

SI UNITS The units in which measurements were made should be cited. If they are not SI units the factors for conversion to SI units should be given as a footnote. This is the responsibility of the author.

ILLUSTRATIONS Line drawings, graphs, and diagrams should be prepared to professional standards and submitted as originals or as unmounted glossy photographic prints. Particular care is needed with photomicrographs, where detail is easily lost—it is often more informative to show a small area at a high magnification than a large area. Scale bars should be used to indicate magnification. The size of the symbols and lettering (upper and lower case rather than all capitals) and thickness of lines should take account of the likely reduction of the figure—usually to a width of 65 mm. Four copies of each illustration should be submitted. Each should bear a label on the back marked in pencil with the names of the authors and the number of the figure, and the top should be indicated. Legends should be typed on a separate sheet. Authors must pay for colour illustrations.

REFERENCES Responsibility for the accuracy and completeness of references rests entirely with the authors. References will not be checked in detail by the Editors but papers in which errors are detected are unlikely to be accepted. Reference to work published in abstract form is allowed only in exceptional circumstances—for example, to acknowledge priority or indebtedness for ideas. References should be numbered in the order in which they are first mentioned and identified in text, tables, and legends to figures by arabic numerals above the line. References cited only (or first) in tables or legends should be numbered according to where the particular table or figure is first mentioned in the text. The list of references should be typed in double spacing and in numerical order on separate sheets. The information should include reference number, authors' names and initials (all authors unless more than six, in which case the first six names are followed by *et al*), title of article, and in the case of journal articles name of journal (abbreviated according to the style of *Index Medicus*), year of publication, volume, and first and last page numbers. The order and the punctuation are important and should conform to the following examples:

- 1 Anderson HR. Chronic lung disease in the Papua New Guinea Highlands. *Thorax* 1979;34:647-53.
- 2 Green AB, Brown CD. *Textbook of pulmonary disease*. 2nd ed. London: Silver Books, 1982:49.
- 3 Grey EF. Cystic fibrosis. In: Green AB, Brown CD, eds. *Textbook of pulmonary disease*. London: Silver Books, 1982:349-62.

REVIEWING PROCESS Papers submitted to *Thorax* will be assessed by the Executive Editors and those considered unsuitable for publication will be returned directly to the authors. All other papers will be peer reviewed by an associate editor and at least one other reviewer. Rapid Communications will be reviewed and returned to the authors within 4 weeks, and published 2 or 3 months after acceptance.

CORRESPONDENCE The Editors welcome letters related to articles published in *Thorax*. These should not exceed 300 words or contain more than three references, which should be listed at the end of the letter. Letters should be typed in double spacing with wide margins and must be signed by all authors. **REPRINTS** Reprints are available at cost if they are ordered when the proof is returned.

NOTICE TO ADVERTISERS Applications for advertisement space and for rates should be addressed to the Advertisement Manager, *Thorax*, BMJ Publishing Group, BMA House, Tavistock Square, London WC1H 9RJ.

NOTICE TO SUBSCRIBERS *Thorax* is published monthly. The annual subscription rate is £203.00 (\$319.00) worldwide. Orders should be sent to the Subscription Manager, *Thorax*, BMJ Publishing Group, BMA House, Tavistock Square, London WC1H 9RJ. Orders may also be placed with any leading subscription agent or bookseller. Subscribers may pay for their subscriptions by Access, Visa, or American Express by quoting on their order the credit or charge card preferred together with the appropriate personal account number and the expiry date of the card. For the convenience of readers in the USA subscription orders with or without payment may also be sent to *British Medical Journal*, PO Box 408, Franklin, MA 02038, USA. All inquiries, however, must be addressed to the publisher in London. All inquiries about air mail rates and single copies already published should also be addressed to the publisher in London. Second class postage paid at Rahway New Jersey. Postmaster: send address changes to *Thorax* c/o Mercury Airfreight International Ltd Inc, 2323 Randolph Avenue, Avenel, NJ 07001, USA.

LETTER TO THE EDITOR

Lung disease induced by drug addiction

In their editorial on the pulmonary consequences of illicit drug use (November 1995; 50:1125-7) Benson and Bentley draw attention to barotrauma as a complication of cocaine inhalation. Pneumothorax, pneumomediastinum, and pneumopericardium have also been described, however, in association with the use of marijuana,^{1,2} a drug that is more widely used in England and Australia than cocaine. The mechanism of injury is thought to be by coughing while breath-holding in inspiration, or by performance of a Valsalva manoeuvre. The latter has been recognised as a cause of spontaneous pneumomediastinum since the 17th century.³ We have found it rewarding to seek a history of illicit drug use in young adult patients presenting with spontaneous pneumothorax.

BOOK NOTICES

Lung Cancer. Desmond N Carney. (Pp 280; £60.00). London: Arnold, 1995. 0-340-56759-7.

The incidence of lung cancer has risen rapidly in recent years. The growing importance of the disease is illustrated by a great number of books on the topic. It is therefore not surprising to encounter a new book presenting state-of-the-art knowledge on lung cancer.

This book is a multiauthored work. In its 280 pages it covers numerous recent advances in our knowledge of lung cancer, is well edited, and has a pleasant uniformity of style. It is divided into two parts. The first contains chapters on chemoprevention, pathology, and staging of lung cancer. Four chapters – the best in my opinion – are focused on the treatment of the disease. The preoperative therapy and surgery, as well as the chemotherapy and radiation for lung cancer, are described in a thorough and generally well referenced fashion. There are also two well

written chapters on cytokines and biological response modifiers in the treatment of lung cancer. The second part addresses the biology of the disease. In its seven chapters the latest aspects about the neuropeptide growth factors, monoclonal antibodies and molecular genetics of lung cancer are thoroughly analysed.

In general all of the chapters are well written with tables and figures and an extensive up to date bibliography. Controversial topics are well presented and the areas in which our knowledge is incomplete are indicated. The authors emphasise the need for ongoing multicentre clinical trials to resolve controversial issues. The book also provides valuable summaries of a vast amount of knowledge pertaining to virtually every aspect of lung cancer.

Because each chapter is written by a different author, there is – as in most multiauthored books – a heterogeneity in the depth at which the topics are covered; for example, very little is provided on the radiology of non-small cell lung cancer. Nevertheless, this book is well written, clearly organised, and comprehensive in scope. It is useful for anyone who is involved in the treatment and care of patients with lung cancer. – AR.

Atlas of Human Cross-Sectional Anatomy. 3rd Edition. Donald R Cahill, Matthew J Orland, Gary M Miller. (Pp 312; £122.50). USA: Wiley-Liss Inc, 1995. 0 471 59165 3.

Atlases of human anatomy have undergone a renaissance thanks to cross-sectional imaging techniques, notably computed tomography (CT) and magnetic resonance imaging (MRI), which provide an alternative view to beautiful but sometimes arcane dissections. In the third edition of this handsome atlas attention is again focused on the fine detail of line drawings of transverse sections of cadavers. At a rough estimate, there is four times as much labelling on the meticulous line drawings than on the cross-sectional photographs or MRI/CT images. Despite the fact that the CT images can no longer be regarded as state-of-the-art (as the authors acknowledge), there is more anatomical detail in these images than the labelling suggests. Perhaps this is a deliberate ploy to get readers to find out what the unlabelled bits and pieces are by looking at the line drawings. The most surprising discovery is the cursory coverage of the bronchial tree (for example, the right middle lobe bronchus does not appear in the index or in any illustrated section). There is no attempt to tackle the three-dimensional jigsaw puzzle of the bronchopulmonary segmental anatomy. Indeed, the CT sections of the thorax are imaged exclusively for mediastinal detail. For readers of *Thorax* this must be regarded as a major disadvantage; it is difficult to be impressed with rudimentary labelling that is confined to the lobes of the lungs. Overall, the treatment of the thorax is slight – 10 pages devoted to the knee versus nine pages covering the chest seems unbalanced. Nevertheless this is a fine example of an atlas that takes full advantage of cross-sectional imaging and can be considered a more than adequate refresher of anatomy, particularly that outside the thorax. – DMH

Asthma and Outdoor Air Pollution. Department of Health: Committee on the Medical Effects of Air Pollutants (Pp 195; £21.00). UK: HMSO Books, 1995. 0 11 321958 X.

Air pollution has been a hot topic in the media in the last few years and has been blamed for many respiratory problems. Doctors are often drawn into the debate by patients wishing to know if they are victims of air pollution. It has been difficult for the doctor to find reliable evidence to reply to the patient. Help is now at hand in the form of this book which reports the extensive and considered deliberations of the Committee on Medical Effects of Air Pollutants and their relationship to asthma. The book contains a wealth of information and is ordered into sections addressing relevant questions such as whether (1) there are plausible mechanisms, (2) short term exposures can worsen asthma, (3) ambient air pollution induces asthma, (4) changes in asthma prevalence correspond to changes in air pollution, and others.

Each chapter comprises a critical discussion of all the studies that address the topic and assesses what can be deduced from those studies. Each section is fully referenced and there are many helpful tables and figures. Finally, the conclusions set out what can be inferred from the present knowledge.

The committee producing this work consisted of a mix of clinicians and basic scientists with strong academic credentials which are reflected in the logical approach to the subject, the considered analysis of the evidence, and the dispassionate conclusions they have reached. Although this book is not bedtime reading, it is not difficult to read and will enable doctors and other health professionals to answer the questions posed by their patients. A copy should be in every medical library and any doctor interested in pollution will want their own copy. – MGP

NOTICE

British Association for Lung Research

The Summer Meeting of the British Association for Lung Research will be held at the Biological Sciences Building (Boldrewood), University of Southampton on 19-20 September 1996. For further information contact Mrs Chris Vincent. Telephone: 01703 796891. Fax: 01703 701771.

CORRECTION

In the editorial entitled "Acute lung injury following lung resection: is one lung anaesthesia to blame?" by E A Williams, T W Evans and P Goldstraw which appeared on pages 114-6 of the February issue, the order of the authors should have been E A Williams, P Goldstraw and T W Evans. The publishers apologise for this error.
