Neutrophils provide the body’s first line of defence against invading pathogens. They respond to infection by releasing an array of chemokines, cytokines, and superoxide anions that initiate cascades of other immune mediators and cell types. Although the rapid response and flexibility of neutrophils make them an integral part of the other immune mediators and cell types. Although the rapid response and flexibility of neutrophils make them an integral part of the body’s immune system, human cytomegalovirus (HCMV), paradoxically, may use neutrophil activation for its own evolutionary advantage. Here we report that human peripheral blood neutrophils exposed to a clinical strain of HCMV display a profound survival phenotype that occurs independent of viral gene expression. The initial HCMV driven survival response was partially dependent on ERK1/2 activation and profoundly inhibited by inhibition of NF-kB. Intriguingly, this initial survival event triggered by virus binding was augmented by a cytokine mediated effect whereby supernatants from infected neutrophils provided uninfected neutrophils with substantial protection against apoptosis – a protection which was PI3K as well as ERK1/2 and NF-kB dependent.

Concomitantly with a transferable survival effect the HCMV-neutrophil secretome also markedly manipulated autologous donor monocytes. Enhanced migration and subsequent differentiation to a permissive phenotype for HCMV infection was suggestive of a mechanism for efficient viral dissemination from the site of initial infection. Fascinatingly, although differentiation to a permissive phenotype was observed this was concomitant with down-regulation of a number of key activators of the adaptive immune response. Overall, these data illustrate the manipulation of an anti-viral response by a pathogen to enhance the outcome of infection which, intriguingly, involves a cell type not productively infected by the pathogen itself. These data further illustrate the complexity of pathogen interactions with the host immune system as well as providing new clues into the mechanisms HCMV exploits for efficient viral dissemination which could have implications on our understanding for HCMV pathogenesis.

Methods We wrote to all PCTs in England, (under the Freedom of Information Act, 2000) for information on sleep studies commissioned, and CPAP prescriptions issued, for the years ending 31 March, 2008, 09, and 10. The PCTs were also asked who provided sleep studies or CPAP on their behalf (NHS hospital, GP, private, or other provider). Some PCTs did not reply, or claimed not to hold data, so we contacted appropriate NHS hospitals to obtain further information. Sleep study data was only obtained from approximately 75% of PCTs or associated hospitals. An alternative set of data, on the Department of Health (DH) website, was also used. Limited sales data from CPAP companies was also available for comparison.

Results In almost all PCTs, sleep studies and CPAP provision were from NHS hospitals. The incomplete data from PCTs showed that sleep studies rose from about 30,000 in 2007/8 to 48,000 in 2009/10, a 3-year increase of about 60%. Data on sleep studies published by DH rose from over 61,000 in 2007/8 to over 86,000 in 2009/10, a 3-year increase of 41%. For CPAP prescriptions issued, only 66% of PCTs submitted data for 2007/8, rising to a 75% response by 2009/10. On the basis of this incomplete information and with some assumptions, annual CPAP prescriptions rose from less than 17,000 in 2007/8 to over 57,800 by 2009/10, a three year increase of 126%. There may be some under-reporting in the earlier years, and the industry sources suggested a 3-year lower increase of nearer 80%. In addition there are likely to be errors of coding. However, there was wide variation between PCTs suggesting patchy performance.

Conclusions We believe that the results show a clear improvement in the number of sleep studies and CPAP prescriptions over this period. Thus, following the NHICE TA there has been an improvement in patient access to the diagnosis and treatment of sleep apnoea, though we are concerned that the wide variation suggests there is a substantial element of post-code lottery.

Improving the care of sleep apnoea

We have assessed whether Primary Care Trusts’ (PCTs) commissioning of sleep services has improved following the NIHCE 2008 technology appraisal on CPAP.
P258 Change in Sleep Study and CPAP Provision Following the NIHCE CPAP TA
