An 18-year-old female subject with a history of decortication for right sided, postpneumonic pleural thickening presented with haemoptysis. A CT pulmonary angiogram showed marked hypoplasia of the right main, lobar and segmental pulmonary arteries, along with reduced volume of the right lung. Prominent bronchial artery supply to this lung was noted (figure 1) with absence of pulmonary veins. Perfusion scintigraphy showed only 4% perfusion to the right lung and normal perfusion of the left lung (figure 2). Pulmonary artery hypoplasia has been reported to be associated with ipsilateral pulmonary venous atresia. It can present with symptoms mimicking pulmonary embolism.

**Learning points**

▸ Pulmonary artery hypoplasia is a rare cause of haemoptysis. The source of bleeding is usually from hypertrophic bronchial arteries.
▸ CT pulmonary angiogram combined with perfusion scintigraphy is very useful in making the diagnosis non-invasively.
Acknowledgements  Mr Ivor Dixon, Medical Physicist, Royal Cornwall Hospital, Truro, Cornwall, UK for providing the new figure.

Competing interests  None.

Patient consent  Obtained.

Provenance and peer review  Not commissioned; internally peer reviewed.
