Introduction The two replicate, randomised, placebo-controlled, 52-week Phase III INPULSIS® trials assessed the efficacy and safety of nintedanib 150 mg twice daily (bid) in patients with idiopathic pulmonary fibrosis (IPF). Patients with forced vital capacity (FVC) $\geq 50\%$ predicted were included. The primary endpoint, the annual rate of decline in FVC, was significantly reduced in the nintedanib group compared with placebo in both trials, consistent with a slowing of disease progression. Key secondary endpoints were time to first acute exacerbation and change from baseline in St. George's Respiratory Questionnaire total score, both over 52 weeks. In a pre-specified subgroup analysis of patients with baseline FVC $\leq 70\%$ versus $>70\%$ predicted, the treatment effect of nintedanib on decline in FVC was consistent in both subgroups.

Methods A *post-hoc* subgroup analysis of patients with baseline FVC $>90\%$ versus $\leq 90\%$ predicted was undertaken using pooled data from the INPULSIS® trials to investigate whether patients with marginally impaired FVC receive the same benefit from nintedanib.

Results 274 patients (nintedanib 166, placebo 108) had baseline FVC $>90\%$ predicted and 787 patients (nintedanib 472, placebo 315) had baseline FVC $\leq 90\%$ predicted. There was no significant treatment-by-subgroup interaction for the primary endpoint ($p = 0.5300$); in patients with baseline FVC $>90\%$ predicted, the adjusted annual rate of decline in FVC was -91.5 mL/year with nintedanib and -224.6 mL/year with placebo (difference: 133.1 mL/year [95% CI: 68.0, 198.2]) while in patients with baseline FVC $\leq 90\%$ predicted, it was -121.5 mL/year with nintedanib and -223.6 mL/year with placebo (difference: 102.1 mL/year [95% CI: 61.9, 142.3]). Consistent results were observed for changes from baseline in FVC over time (Figure 1). No significant treatment-by-subgroup interaction was observed for the key secondary endpoints. The frequency of adverse events and

serious adverse events was comparable between the treatment arms of each subgroup.

Abstract S108 Figure 1

Conclusion In a subgroup analysis of pooled data from the INPULSIS® trials, nintedanib 150 mg bid slowed the decline in lung function in patients with IPF independent of degree of lung function impairment at baseline, suggesting that patients with marginally impaired FVC also benefit from treatment with nintedanib.

S109 EFFECT OF CONTINUED TREATMENT WITH PIRFENIDONE FOLLOWING A CLINICALLY MEANINGFUL DECLINE IN PERCENT PREDICTED FORCED VITAL CAPACITY IN PATIENTS WITH IDIOPATHIC PULMONARY FIBROSIS (IPF)
