Supplementary Fig. 2

PDGFRβ activity in MMe cells upon Gemcitabine or Pemetrexed treatment.

Immunoblotting with antibodies recognizing PDGFRβ (PDGFRβ) and its phosphorylated (active) form (P-PDGFRβ) on whole lysates of MMP and REN cells.

α-tubulin antibodies were used as loading controls.

Cells were in low serum ( - ), stimulated with PDGF or treated 2 or 12 hours with LC50 concentrations of the indicated chemotherapeutics in presence or absence of 10 μM Imatinib.
