### **TABLETS**

- \* are invaluable in cases of respiratory depression and failure
- \* deepen breathing without increasing the rate of respiration
- \* increase blood oxygen
- \* lower blood  $\text{CO}_2$
- \* produce no electrolytic upset
- \* action is confined mainly to the respiratory centre, with minimal other central effects
- \* are non-toxic even in repeated dosage

*Composition:* Each tablet contains 100 mg. amiphenazole.

*Dosage:* 1-2 tablets 3-4 times daily  
Usual dosage is 4 tablets daily.

*Packs and basic N.H.S. cost:* Container of 20 tablets... 9/9d.  
Container of 100 tablets...46/-

Samples and literature will be sent on request

## ORAL PENICILLIN ACTIVE AGAINST RESISTANT STAPHYLOCOCCI

**ORBENIN** is indicated for immediate use in known or suspected resistant staphylococcal infections, and in mixed Gram-positive infections (e.g. infected burns) where resistant staphylococci may be present.

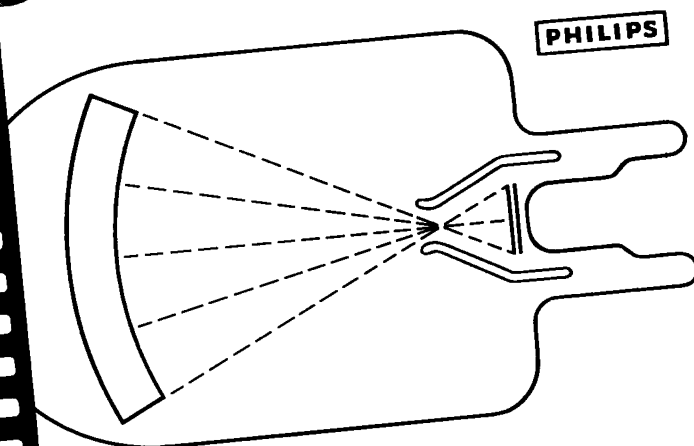

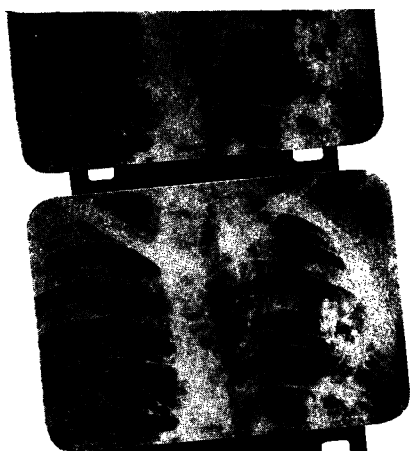

- Orbenin is stable to staphylococcal penicillinase and highly effective against 'resistant' staphylococci. Its activity is four times that of methicillin.
- Orbenin is also highly effective against other Gram-positive organisms, including streptococci, pneumococci and penicillin-sensitive staphylococci.
- Orbenin is bactericidal; it is acid-stable and well absorbed by either the oral or intramuscular routes.

Dosage by mouth is 500 mg. 6 hourly. Dosage by intramuscular injection is 250 mg. four to six hourly.

## Staphylococcal infections of the respiratory tract

respond to **FUCIDIN**

'Patients who are in hospital for more than seven days tend to become infected with hospital strains of *Staph. aureus* in their lungs . . . The lung is a common primary site of staphylococcal septicæmia . . . Staphylococcal bronchopneumonia, or lung abscess, is a common accessory and occasionally a primary factor in death after abdominal operation, or indeed after admission to hospital at all . . . A major reservoir of hospital staphylococci, and a possible source of skin and wound infection, is the lungs of patients.'

'Fucidin is a highly active antistaphylococcal antibiotic.'<sup>1</sup>

clinical research

application of fibrinolysis

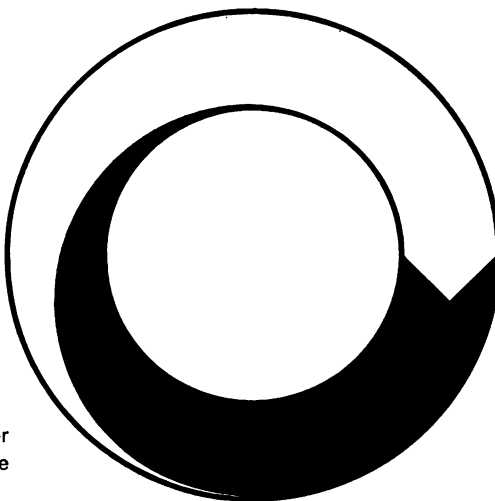

# thrombolytic therapy

Urokinase, a development of LEO PHARMACEUTICAL PRODUCTS DENMARK, is a potent plasminogen activator of human origin, and has shown marked freedom from antigenic, pyrogenic and other untoward reactions in clinical trials so far carried out.

One of the many important clinical fields in which fibrinolytic activity may possibly be applied with advantage is that of acute thrombotic states, particularly those occurring in the larger blood vessels.

In a recent Leading Article in the British Medical Journal, 1962, vol. i: p. 1399, the role of plasminogen activators in thrombolytic therapy is discussed, and the following comment made:

**'The balance of evidence suggests that activator is the best thrombolytic agent. Of the two possible activators urokinase holds more promise ...'**

# The easiest TB treatment of all

## INAPASADE twice a day

INAPASADE is the easiest and most pleasant way of taking PAS and isoniazid - - combined in non-irritant, tasteless granules that are swallowed effortlessly with a drink

Only two doses a day provide 12 G. sodium PAS with 300 mg. isoniazid. By removing the unpleasantness associated with this treatment and eliminating the inconvenient mid-day dose, Inapaside secures the enthusiastic co-operation of the TB patient at home and helps to obviate lapses in treatment.

Tins of 60 and 120 one-dose packets and bulk granules pack for hospitals.

**tasteless non-irritant granules**

- ❑ **FUNDAMENTAL APPROACH TO SURGICAL PROBLEMS** by Lester F. Williams, Jr., and Garnet F. Wynne, Jr., both of Tripler General Hosp., San Francisco. Jan. '62, 232 pp., 15 illus., \$7.75.

# the Melrose-NEP

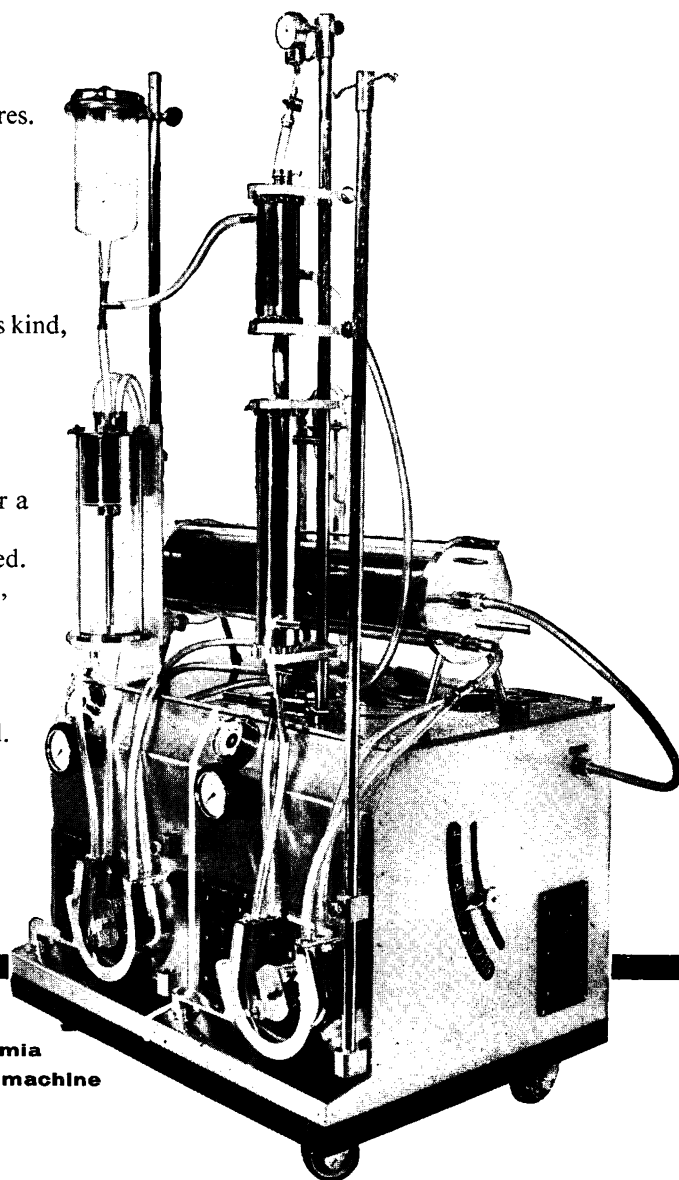

In the design of the Melrose-N.E.P. Perfusion Apparatus, simplicity and flexibility are the predominant features. The same unit can be used for

- (a) artificial oxygenation with or without hypothermia
- (b) profound hypothermia
- (c) other extra corporeal perfusion techniques

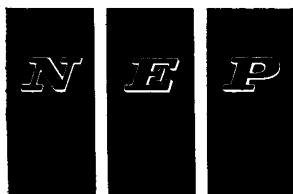

Although the most compact unit of its kind, all essential facilities are included.

To the basic unit consisting of twin blood pumps, tachometers, oxygenator drive, etc. can be added other components as required for particular techniques. Mountings for a blood filter are provided and a chest cavity pump can also be fitted. The reliable DeBakey Roller Pumps, which have low priming volumes, give accurately controlled outputs variable from 0.5-5 litres/minute.

All parts are easy to clean: all blood surfaces can be autoclaved. A rotating disc oxygenator of the well-tried Kay-Cross type gives high oxygenation rates with low haemolysis.

# Perfusion Apparatus

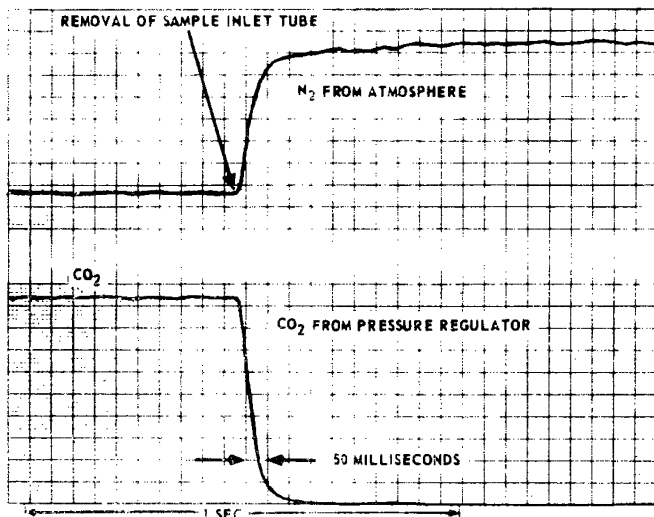

The Perfusion Unit fitted with medium heat exchanger for profound hypothermia of children. Inset shows large heat exchanger used for adults. There is also a smaller heat exchanger for localised cooling.

**As a profound hypothermia machine**

The Heat Exchanger Control Trolley provides the cooling/warming fluid for the heat exchangers, accurately controlled to pre-set values of temperature and flow.

# WHAT DOES THIS recording SHOW?

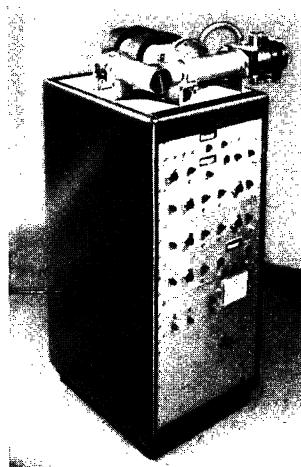

directly from the pressure regulator. In this particular run, CO<sub>2</sub> from the pressure regulator was fed into the inlet through the sample inlet tube. The inlet was abruptly interrupted by the removal of the sample inlet tube. CO<sub>2</sub> data as measured on the pressure regulator was also fed into the mass spectrometer. The mass spectrometer was designed to provide a high speed response to changes in the sample gas composition.

- High speed analysis. High signal-to-noise ratio.
- Intensity greater resolving power than hitherto available T.O.F. Mass Spectrometers.
- Five output channels for continuous monitoring of the five components of the breathable atmosphere, plus one in reserve.
- Dynamic range at least 10 to 1 at 28 AMU (Nitrogen) position in mass spectrum.
- Three instant techniques - for sampling at 0.1, 1 ft. or 25 ft. distance.

WHEN A  
FREE FLOW  
OF AIR IS  
NEEDED

**New relief for bronchitic patients.** New relief for chronic bronchitis is now available in ALUPENT. ALUPENT is a powerful and long-acting bronchodilator presented as tablets for prophylaxis, as Inhalant solution for the asthma attack, and in ampoules for the acute attack. The tablets, which are swallowed, have a duration of action of up to four hours. ALUPENT may be given concurrently with antibiotics, expectorants or mucolytics. In a recently completed two-year trial involving 100 cases, of which a large majority displayed the asthma-chronic bronchitis-emphysema syndrome with marked dyspnoea and wheezing, 92 showed either a "very good" or a "satisfactory" response. The author comments: "This trial shows clearly that the majority of such cases can be more effectively maintained on Alupent than on other oral bronchodilator therapy." Dosage: 2 tabs. q.d.s.
