We read the study by Zoëllner and colleagues published recently in *Thorax* about the level-ling off of asthma and allergies among children in Germany between 1992 and 2001. We have published a study looking at the same issue and using a similar protocol (ISACA)^1^ to assess the symptoms, diagnosis, and severity of asthma and allergies in more than 15,000 children aged 6–7 and 13–14 years between 1995 and 2000 in Munich, Germany. We found a tendency towards an increase in current symptoms of asthma and allergies in both age groups, but more so among girls.

Indices of diagnosis either remained the same or increased in parallel with the increase in symptoms, arguing against a change in diagnostic behaviour as an explanation for our results. Indices of severity also showed a homogenous increase in the 5-year study period, pointing towards an increase in the overall burden of asthma and allergies within the society.

Regrettably, these results, coming from Germany, were not considered in either the discussion of Zoëllner’s report or in the affirmative title that no increase in asthma and allergies occurred in Germany in the 1990s. Even more regrettable is the fact that when our study was alluded to in the discussion and conclusion of the paper by Zoëllner et al., it was cited—contrary to our results—as one of the studies showing a decrease or levelling off of asthma and allergies among children.

In the paper entitled “No increase in the prevalence of asthma, allergies, and atopic sensitisation among children in Germany: 1992–2001” by K.Zöllner et al. which appeared in the July 2005 issue of *Thorax* (2003:58:545–8), the authors apologise for a mistake which occurred in the reference list. Reference number 18 should be number 21 and references 19–21 should be listed as 18–20.
