Poster sessions

exacerbations and exclusion criteria. The analysis was limited to patients aged = 45 years to reduce contamination by COPD. Patients with non-asthma respiratory diagnoses were excluded. Results In the 3 year period about 395,000 patients received repeated medications for asthma with a monthly point prevalence of 255,000 asthma patients; equating to a prevalence of 7.0% of the 3.6 million people aged 0–45 registered with a GP in Scotland. These patients collected 5.6 million prescriptions for inhaled/oral therapies and 253,000 short courses of oral corticosteroids were dispensed to these patients in primary care. Patients were categorised on a daily basis into BTS Steps 1–5 according their medication use. As of June 2011: 83,663 (32.4%) of patients were in Step 1; 99,374 (35.3%) were in Step 2; 42,555, (16.3%) were Step 3; 27852 (10.8%) were Step 4, and 4,500 patients (1.7%) were Step 5 receiving daily oral corticosteroids. Table 1 presents the exacerbation rates for these patients, 1.9% of the patients received an emergency short course of prednisolone. Conclusion This current and whole population database indicates that in Scotland asthma prevalence is about 7% in this age group. The proportion of asthma patients treated at Steps 3–5 (25%) is greater than the often quoted 15%. Although proportionately small, a sizeable number of patients (~7000) with Step 1 and 2 asthma had at least one exacerbation requiring short course prednisolone and/or hospital contact over a three year period.

**P17** THE BURDEN OF ICS/LABA-TREATED ASTHMA PATIENTS IN THE UK ADULT POPULATION

1D Price, 2N Mathieson, 3A Mulgirigama, 4A Scozzi, 6R Pedersini, 7G Isherwood, 1D Paword; 1Academic Centre of Primary Care, University of Aberdeen, Aberdeen, UK; 2Boehringer Ingelheim Ltd UK, Berkshire, UK; 3Kantar Health, Epson, UK; 4University Hospitals of Leicester NHS Trust, Institute for Lung Health, Glenfield Hospital, Leicester, UK

Objectives According to NHS QOF (Quality and Outcomes Framework) figures, 3.3 million UK citizens have asthma. Previous studies have shown an association of asthma with increased direct and indirect healthcare costs, but similar studies have not been conducted specifically for UK asthma patients. The aim of the current study is to assess the impact of poor asthma control on UK patients treated with ICS + LABA maintenance treatment.

Methods Data were from the 2010 and 2011 UK National Health and Wellness Survey (NHWS), an Internet-based questionnaire from a representative sample of UK adults stratified by age and gender. 701 respondents self-reported a diagnosis of asthma without concomitant COPD, chronic bronchitis, or emphysema and were currently being treated with ICS + LABA.

Patients Not Well Controlled (NWC) according to ACT (score < 20) were compared to well-controlled (WC) patients (score ≥ 20) on demographics, medications, health status, BMI, comorbidities, adherence (MMAS-4), healthcare use (number of physician visits, emergency visits and hospitalizations), work productivity and activity impairment (WPAI) and health-related quality of life (HR-QoL) (SF-12).

Results A greater proportion of the 452 NWC patients (64% of the overall sample) go to emergency (21% vs. 14%, p = 0.016) or are hospitalised (13% vs 8%, p = 0.022), in comparison with the WC; Their mental and physical HR-QoL is lower (SF-12 MCS: 43 vs. 47/100; PCS: 40 vs. 48/100; Health utility: 0.65 vs. 0.74/1.00; all p’s < 0.001); while their work and activity impairment are greater: presenteeism (23% vs. 11%, p < 0.001), overall work impairment (29% vs. 17%, p < 0.001) and activity impairment (46% vs. 24%, p < 0.001). In the current sample, NWC did not show significantly different levels of adherence from WC (50% vs. 55%, p = 0.361).

Conclusions Over 60% UK ICS + LABA-treated adult patients are poorly controlled. Poor control is associated with lower HR-QoL, greater healthcare use and productivity impairment, but not with significantly different levels of adherence to WC patients. The recognition of patients remaining symptomatic and utilising healthcare resource whilst treated with ICS + LABA maintenance therapy is an important step to improving their management.

P18 IDIOPATHIC PULMONARY FIBROSIS SURVIVAL HAS NOT IMPROVED IN THE 21ST CENTURY: ANALYSIS OF CPRD GOLD PRIMARY CARE DATA

1Im Maher, 2H Strongman, 3R Boggon, 4P Kasaar; 1Royal Brompton Hospital, London, United Kingdom; 2Clinical Practice Research Datalink, London, United Kingdom; 3InterMune UK and Ireland, London, United Kingdom

10.1136/thoraxjnl-2013-204457.168

Introduction and Objectives Idiopathic pulmonary fibrosis (IPF) is a progressive and invariably fatal disease. Historical cohort studies have reported a median survival of 2.8–3.2 years. The UK has seen a number of important developments for IPF patients in the last year which it is hoped will translate to improved outcomes for individuals with this devastating disease. These include: the licensing and approval by NICE of the first anti fibrotic therapy, pirfenidone; specialist commissioning of ILD services; and publication of NICE IPF guidelines. If the impact of these important developments is to be measured it is vital that current IPF disease burden is understood.

Methods The incidence and mortality of IPF-Clinical Syndrome, using broad and narrow disease definitions, was assessed via the Clinical Practice Research Datalink (CPRD) GOLD dataset.

Results The incidence of broadly defined IPF-CS between 2000–2012 was 8.65 (95% CI 8.40–8.90) per 100,000 person years and significantly increased over time (incidence rate ratio adjusted by gender, region and age category = 1.02, p for linear trend <0.0001). Kaplan-Meier survival estimates show no significant survival difference by year of diagnosis (log rank test for equality of survivor functions, p = 0.17) with a median survival of 3.0 years (95% CI 2.8–3.1). There was no significant survival difference for broad and narrow definitions (log rank test for equality of survivor functions, p = 0.06) validating the definition of IPF-CS.

Conclusions In keeping with previous data the incidence of IPF-CS continues to rise and the survival time from diagnosis remains unchanged. The mortality burden of IPF-CS is therefore increasing. The results of this study provide an important benchmark against which the effects of changes in the management and delivery of care for individuals with IPF can be measured.
WORRYING TREND OF LABELLING AMBIGUOUS DEATHS AS PNEUMONIA AND POTENTIAL IMPACT ON RESPIRATORY SERVICE IN A DISTRICT GENERAL HOSPITAL

1. N. Tan, 2E. Davies, 3S. Javed, 4R. Sunda, 5A. Aziz; 1East Lancashire Hospitals, Blackburn, UK; 2Respiratory Medicine, Royal Albert Edward Infirmary, Wigan, UK; 3School of Medicine, University of Manchester, Manchester, UK

Background Pneumonia is a common cause of death recorded on death certificates. This data is used by Dr Foster to calculate hospital specific mortality rate (HSMR). However there is a general impression that pneumonia is recorded as cause of death without confirmation. The British Thoracic Society (BTS) defines pneumonia as ‘symptoms and signs consistent with an acute lower respiratory tract infection associated with new radiographic shadowing for which there is no other explanation’ aspiration pneumonia 20 patients, bronchopneumonia 8 patients, community acquired pneumonia 19 patients, pneumonia 44 patients and hospital acquired pneumonia 20 patients. Out of these 111 patients, 75 (67.6%) patients had radiological changes consistent with a diagnosis of pneumonia on CXR. Out of these 75 patients with radiologically confirmed pneumonia 29 (38.7%) were given incorrect antibiotics as they were treated mainly for sepsis.

Conclusions Our findings show a very worrying trend of incorrectly recording pneumonia as cause of death in a third of patients, who were given pneumonia as cause of death. This would increase the HSMR for pneumonia as calculated by Dr Foster. In our opinion pneumonia as a cause of death is an easy option for many medical practitioners.

Recommendations We recommend an early input by respiratory physicians for all respiratory admissions to make sure that respiratory illnesses are managed correctly.
