

**Abstract P128 Table 1** Safety comparison of respiratory interventions in patients attending a severe asthma service

	Airway clearance techniques n (%)	Hypertonic saline-7% challenge n (%)	Bronchoscopy n (%)
No asthma symptoms	114 (100%)	109 (93%)	89 (90%)
Bronchospasm requiring nebulised SABA <sup>1</sup>	0 (0%)	8 (7%)	8 (8%)
Severe Asthma Exacerbation	0 (0%)	0 (0%)	2 (2%)
Total	114	117	99

<sup>1</sup> Short acting beta-agonist

**Conclusion** In patients attending a severe asthma clinic physiotherapy techniques (ACT and HS-7) were safe and effective. Bronchoscopy had similar requirement for rescue salbutamol nebulisation compared to HS-7, but a higher risk (2%) of severe asthma exacerbation.

#### P129 FUNGAL CONTAMINATION OF VALVED HOLDING CHAMBERS (VHCs): POTENTIAL TO PREVENT, AND EFFECT ON DRUG DELIVERY

<sup>1</sup>MJ Sanders, <sup>1</sup>R Bruin, <sup>2</sup>CH Tran. <sup>1</sup>Clement Clarke International Ltd, Harlow, UK; <sup>2</sup>i2c Pharmaceutical Services, Cardiff, UK

10.1136/thoraxjnl-2016-209333.272

**Introduction and objectives** Able Spacer<sup>®</sup>-2 VHC (AS2) is one of many accessory devices available to improve pressurised metered dose inhaler (pMDI) drug delivery, but uniquely includes a ~ 1wt% body polymer silver ion additive (~ 1%Ag+) to combat microbial growth and reduce static. Drug-specific bacterial growth on VHC polymers<sup>1</sup> and the bacterial growth-reducing effects of the Ag+ polymer are known.<sup>2</sup> The fungal pathogen

*Aspergillus fumigatus* causes serious pulmonary disease. We assessed the effect of 4%Ag+ on fungal activity and, subsequently, drug delivery characteristics.

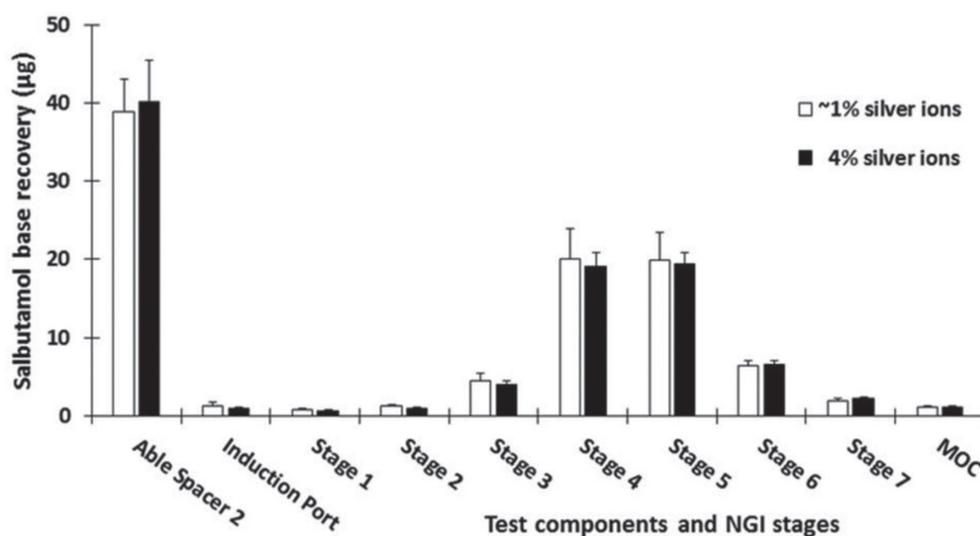

**Methods** Determination of fungal sporicidal activity was via modified ISO22196:2011 using flat body polymer discs (n = 3) of AS2 ~ 1% Ag+ and AS2 4%Ag+, and sterile Control (same polymer minus Ag+, n = 6). 100mL *A. fumigatus* (5.0 x 10<sup>5</sup> spores/mL distilled water) was pipetted onto disc surfaces. Samples were incubated for 24 h at 35°C/ ≥ 95% relative humidity, with silver ions neutralised thereafter. Colony forming units (CFU) were enumerated by spiral dilution and converted to CFU/cm<sup>2</sup>. Aerosol performance of salbutamol (as salbutamol sulphate) pMDI (Ventolin<sup>®</sup> Evohaler, GSK) through AS2 VHC (~ 1% Ag+ as standard) and a newly-developed AS2 4% Ag+ VHC was assessed through a Next Generation Impactor (NGI) at 30 L/min. pMDIs and NGI were operated, and drug determinations made, using standard procedures.

**Results** 24 h geometric mean Log<sub>10</sub> *A. fumigatus* CFU/cm<sup>2</sup> were 4.2 x 10<sup>3</sup> (Control), 2.8 x 10<sup>3</sup> (~ 1% Ag+), and 4.5 x 10<sup>2</sup> (4% Ag+), representing Log<sub>10</sub> and% reductions from Control of 0.2 (34%) and 1.0 (89%) for ~1% Ag+ and 4% Ag+. Key salbutamol aerosol performance data were emitted dose (mg) 95.9 ± 11.0 and 94.9 ± 9.1; fine particle fraction (% < 5.0 mm) 54.0 ± 4.3 and 53.6 ± 1.9; and fine particle dose (mg < 5.0 mm) 52.0 ± 8.7 and 50.7 ± 3.8 for AS2 ~ 1% Ag+ and AS2 4% Ag+ respectively. NGI recovery (Figure 1) profiles were very similar, including the VHC component: 38.9 ± 4.2 (AS2 ~ 1% Ag+) and 40.2 ± 5.3 (AS2 4% Ag+).

**Conclusions** Use of 4%Ag+ additive did not affect salbutamol aerosol performance and showed greater effect on *A. fumigatus* spored activity *in vitro*. VHC fungal *Candida* spp. and nebuliser *Aspergillus* spp. have been identified. The moist, anti-static setting of the Chamber may support and, of more concern, promote aerosolisation into the lungs of fungal material. Further research and understanding are necessary.
