

**Supplementary Table 1.** Summary of studies investigating the microbiome in sputum samples of COPD participants

Author (Year)	Sequencing technique	Participants characteristics	Summary findings
Cabrera-Rubio, et al. (2012) <sup>1</sup>	16S rRNA	8 participants in stable phase	-Microbiome profiling in sputum, bronchial aspirate, BAL and bronchial mucosal biopsy revealed lower diversity in sputum samples compared to the other 3 sample types
Molyneaux, et al. (2013) <sup>2</sup>	16S rRNA, qPCR	14 participants in stable phase, 17 healthy controls	-After rhinovirus infection, there was a rise in bacterial burden and outgrowth of <i>Haemophilus influenza</i> from pre-existing microbiota in COPD participants. This was not observed in healthy controls.
Garcia-Nunez, et al. (2014) <sup>3</sup>	16S rRNA	17 participants in stable phase	-Most prevalent phyla were Proteobacteria, Firmicutes, and Actinobacteria -Patients with moderate disease showed greater microbial diversity than patients with advanced disease - Alpha diversity was decreased in patients with advanced disease
Galiana, et al. (2014) <sup>4</sup>	16S rRNA, qPCR	19 participants in stable phase	-Bacterial diversity was higher in patients with moderate COPD than with severe COPD -Bacterial load was higher in severe COPD -In severe COPD patients, the composition of bacterial genera differed more among themselves, than samples from the mild/moderate group
Huang, et al. (2014) <sup>5</sup>	16S rRNA, qPCR	12 participants; sample collection before, during and after AECOPD	-Abundance of several bacterial phyla differed between stable phase and AECOPD, where Proteobacteria abundance was increased during AECOPD - Steroid and antibiotic therapy showed opposite effects on the microbiome, whereby steroid therapy increased Proteobacteria abundance - <i>Haemophilus influenza</i> abundance was positively correlated to the abundance of phylogenetically related bacteria, whereas the abundance of other bacteria was negatively correlated
Barker, et al. (2015) <sup>6</sup>	16S rRNA, qPCR	120 participants in stable phase, 55 paired stable and AECOPD data	- <i>Haemophilus influenza</i> bacterial load was an independent predictor of sputum TNF-alpha and IL-1beta levels in stable state - at AECOPD, change of <i>Moraxella catarrhalis</i> bacterial load compared to

			stable state correlated with change in sputum TNF-alpha and IL-1beta concentration; this was not observed in <i>Haemophilus influenza</i>
Millares, et al. (2015) <sup>7</sup>	16S rRNA, metagenomics	8 participants with severe COPD; sample collection during stable phase and AECOPD	<ul style="list-style-type: none"> <li>- The relative abundance of bacterial phyla and genera were consistent between stable phase and AECOPD</li> <li>-Functional pathways changed at AECOPD events, indicating a shift of the metabolic functionality of the microbiome towards AECOPD</li> </ul>
Brill, et al. (2015) <sup>8</sup>	Sputum culture; 16S rRNA, qPCR	99 participants in stable phase, 86 completed follow up,	<ul style="list-style-type: none"> <li>-A randomized controlled trial investigating different antibiotic classes (moxifloxacin, doxycycline, azithromycin, placebo)</li> <li>-Total airway bacterial load did not decrease after 3 months of antibiotic therapy</li> <li>-Increases in antibiotic resistance in all treatment groups</li> </ul>
Wang, et al. (2016) <sup>9</sup>	16S rRNA, qPCR	87 participants; sample collection during stable state, AECOPD, 2 weeks post-therapy and 6 weeks recovery	<ul style="list-style-type: none"> <li>-Sputum microbiome profiles were dynamic from stable state towards AECOPD, involving the change of microbial diversities, abundances of bacterial communities and the outgrowth of “keystone bacteria”, such as <i>Haemophilus</i> or <i>Moraxella</i> spp.</li> <li>-Microbiome structure and diversity were correlated with serum and sputum biomarkers</li> <li>-Steroid and antibiotic therapy showed opposite effects on the microbiome with respect to diversity and outgrowth of individual bacteria and bacterial communities</li> </ul>
Wang, et al. (2017) <sup>10</sup>	16S rRNA	281 participants; sample collection at baseline and AECOPD	<ul style="list-style-type: none"> <li>- Microbiome composition shifted from highly diverse to less diverse during AECOPD, where few bacterial genera become predominant abundant</li> <li>-Bacterial dysbiosis was associated with increased exacerbation severity, indicated by higher CAT scores and decrease of lung capacity</li> <li>-Microbial dysbiosis, in concert with eosinophilic inflammation, was associated with even higher exacerbation severity</li> </ul>
Leitao Filho, et al. (2018) <sup>11</sup>	16S rRNA	102 participants hospitalized due to AECOPD, followed for one year after discharge	<ul style="list-style-type: none"> <li>- Microbiome profile in hospitalized AECOPD patients is significantly associated with 1-year mortality</li> <li>-Reduced microbial diversity indicated poorer survival prognosis</li> <li>-The combined absence of <i>Veillonella</i>/presence of <i>Staphylococcus</i></li> </ul>

			was associated with an increased risk of 1-year mortality by 85-fold
Ghebre, et al. (2018) <sup>12</sup>	16S rRNA, RT-PCR panel for common respiratory viruses	73 participants with AECOPD, 32 asthmatic patients with exacerbation	<ul style="list-style-type: none"> <li>-Asthma and COPD patients share 3 exacerbation biological clusters after integrating microbiome profiles and host-inflammatory profiles</li> <li>-Cluster 1: increased pro-inflammatory mediators, evidence of neutrophilic inflammation, bacteria-associated with increased proportions of Proteobacteria and Proteobacteria/Firmicutes ratio</li> <li>-Cluster 2: increased blood and sputum eosinophils, type 2 mediators and increased proportions of Bacteroidetes</li> <li>-Cluster 3: increased type 1 mediators and proportions of Actinobacteria and Firmicutes</li> </ul>
Sinha, et al. (2018) <sup>13</sup>	16S rRNA	4 participants; sample collection during stable phase (two-days, 2-9 months)	<ul style="list-style-type: none"> <li>-Alpha diversity is similar over a two-day period</li> <li>-Microbiome variability was increased over a 9-months period</li> <li>-Firmicutes was the most prevalent phylum, followed by Bacteroidetes</li> </ul>
Mayhew et al. (2018) <sup>14</sup>	16S rRNA	101 participants, 584 (spontaneous and induced) sputum samples from stable and exacerbation time points over 1 year	<ul style="list-style-type: none"> <li>-Subtypes of COPD have distinct bacterial compositions and stabilities over time</li> <li>- Microbiome profiles show less variation within an individual than between individuals, however, some individuals exhibited high variability over time</li> <li>- With increasing disease severity, the abundance of Proteobacteria increases, whereas diversity overall decreases</li> <li>-No significant changes of diversity or taxa relative abundance between stable and exacerbation phase (with the exception of <i>Moraxella</i> spp.)</li> <li>-COPD patients with higher exacerbation frequencies exhibit less stable lung microbiome over time</li> <li>- Microbiome composition of bacterial exacerbations differs from viral and eosinophilic</li> </ul>
Wang et al. (2019) <sup>15</sup>	16S rRNA, qPCR, host RNA microarray, Proteomic assay	16 healthy controls, 43 participants with COPD, sample collection during stable state, AECOPD, 2 weeks post-therapy and 6 weeks recovery, 6 months from	<ul style="list-style-type: none"> <li>- stable COPD patients showed a significantly increased relative abundance of the genera <i>Moraxella</i>, <i>Streptococcus</i> and Actinobacteria, as well as decreased alpha diversity, compared to healthy controls</li> <li>-the relative abundance of <i>Moraxella</i> was increased at stable state in GOLD III versus II patients and in ICS versus non-ICS exposed patients</li> <li>- During AECOPD, the relative abundance of <i>Moraxella</i> was increased and alpha</li> </ul>

		the first stable visit	diversity decreased compared to the stable state, along with significantly increased neutrophil and decreased macrophage percentage. - the trend of increased <i>Moraxella</i> and decreased alpha diversity was reversed at post- exacerbation time points - significant associations between <i>Moraxella</i> and <i>Haemophilus</i> with host transcriptome and proteome profiles of host interferon and pro-inflammatory signaling pathways and neutrophilic inflammation
--	--	------------------------	---

qPCR=quantitative PCR; AECOPD= acute exacerbations of COPD
