1 **Supplementary Methods**

2 **UK Biobank**

3 The UK Biobank study was approved by the National Health Service National Research Ethics

4 Service (ref. 11/NW/0382), and all participants provided written informed consent to

5 participate in the UK Biobank study.

6 **Shift Work Assessment**

7 We defined shift work as previously reported by Vetter et al (1), however, we combined

8 'irregular or rotating shifts with some night shifts' and 'irregular or rotating shifts with

9 ususal night shifts' to form one group 'irregular shift work including nights'. Briefly,

10 participants employed at baseline were asked to report whether their current main job

11 involved shift work (i.e. a schedule falling outside of 9:00am to 5:00pm; by definition, such

12 schedules involved afternoon, eveninig or night shifts (or rotating though these shifts)). If

13 yes, participants were further asked whether their main job involved night shifts, defined as

14 '..a work schedule that involves working though the normal sleeping hours, for instance,

15 working through the hours from 12:00am to 6:00am'. For both questions, response options

16 were 'never/rarely', 'sometimes', 'usually', or 'always' and included additional options:

17 'prefer not to answer' and 'do not know'. Based on those two questions, we derived

18 participants' current shift work status, categorized as 'day workers', 'shift worker, but only

19 rarely if ever nights', 'irregular shift work including nights' and 'permanent night shifts'.

20 In the lifetime employment assessment, individuals reported each job ever worked, the

21 number of years in each job ever worked, the number of years in each job, and the number

22 of night shifts per month each job entailed. We restricted our analysis to those individuals

Supplemental material

BMJ Publishing Group Limited (BMJ) disclaims all liability and responsibility arising from any reliance placed on this supplemental material which has been supplied by the author(s)

Thorax

23 who provided in depth lifetime employment information (N= 107,930), we restricted the

24 employment history to only jobs worked prior to 2008, since this was when the diagnosis of

25 asthma was taken at baseline. We aggregated duration (i.e., number of years working night

26 shifts) and frequency (i.e., the average number of night shifts per month) of night shift work.

27 **Asthma Definition**

28 Cases of asthma were defined by including all those participants with doctor diagnosed

29 asthma at baseline as well as also being on any medication used to treat asthma as defined

30 by Shrine et al. 2019 (2). Cases of moderate-severe asthma were defined as having doctor

31 diagnosed asthma at baseline as well as meeting BTS step 3-5 criteria, i.e. for stage 3 taking

32 $\beta 2$ agonists plus inhaled corticosteroid; stage 4 taking higher dose inhaled corticosteroids

33 than stage 3 patients and addition of a fourth drug (eg, leukotriene receptor antagonist,

34 theophylline); and stage 5, taking oral corticosteroid or omalizumab, or both (2). We

35 excluded participants with doctor-diagnosed asthma who reported not to be on asthma

36 medication (N=18,806) and those on asthma medication but who did not have doctor

37 diagnosed asthma (N=1,345) from our analyses. When analysing the risk of moderate-severe

38 we further excluded participants with asthma taking medication on BTS stage 1 and 2

39 (N=9,455).

40 Within the parameters from the UK Biobank assessment centre data was the question

41 relating to whether a participant had experienced 'Wheeze or whistling in the chest in the

42 last year'. We excluded participants who answered "Do not know" or "Prefer not to answer"

43 from any statistical analyses. Forced expiratory volume in 1-second (FEV_1), predicted

44 percentage, was also analysed. FEV_1 predicted percentages were calculated (3). FEV_1

45 predicted percentages were filtered to produce two sub-populations; $FEV_1 \geq 80\%$ and $FEV_1 <$

Supplemental material

BMJ Publishing Group Limited (BMJ) disclaims all liability and responsibility arising from any reliance placed on this supplemental material which has been supplied by the author(s)

Thorax

46 80%, with the latter indicative of an obstructive respiratory pathology (4, 5) e.g. asthma (6,

47 7). Participants were split into 'yes' and 'no' sub-populations for 'Wheeze or whistling in the

48 chest in the last year'. These and the FEV_1 predicted percentage sub-populations were

49 further split according to participant's current work shift schedule, previously outlined.

50 **Occupational Asthma**

51 We identified participants who were employed in jobs that might lead to the development

52 of occupational asthma. These jobs included bakers, food processors, forestry workers,

53 chemical workers, plastics and rubber workers, metal workers, welders, textile workers,

54 electrical and electronic production workers, storage workers, farm workers, waiters,

55 cleaners, painters, dental workers and laboratory technicians (8-11). We also identified

56 occupations, in which a medical assessment might select against a person with asthma

57 (Protective Service Officers (officers in armed forces, police officers (inspectors and above)

58 and senior officers in fire, ambulance, prison and related services), science technicians and

59 researchers, probation officers and Transport Associate Professionals (including airline pilots

60 and flight engineers, ship and hovercraft officers, train drivers). Both of these were included

61 as covariates in models 2 and 3.

62 **Chronotype**

63 Participants self-reported chronotype on a touch-screen questionnaire at baseline by

64 answering a question taken from the Morningness-Eveningness questionnaire (question

65 19;[12]). The question asks: "Do you consider yourself to be…." with response options

66 "Definitely a 'morning' person", "More a 'morning' than 'evening' person", "More an

67 'evening' than a 'morning' person," "Definitely an 'evening' person," "Do not know," and

68 "Prefer not to answer." Subjects who responded "Do not know" or "Prefer not to answer"

69 were set to missing. This single item has been shown to correlate with sleep timing and dim-

70 light melatonin onset (13-15). For our analyses we combined "more a 'morning' than

71 'evening' person" with "more an 'evening' than 'morning' person" to form an intermediate

72 group. In our initial analysis of chronotype in asthma, we included all individuals with

73 asthma and chronotype information, N= 413,040 (N=398,252 for moderate-severe asthma).

74 Subsequently we investigated shift work in asthma stratified by chronotype (N = 228,671);

75 this excluded participants not in paid employment or self-employed at baseline, or

76 answered "Do not know" or "Prefer not to say" when asked (N=169,581).

77 **Genetic Risk Score for Asthma**

78 Genotyping in the UK Biobank was performed on two arrays, UK BiLEVE and UK Biobank

79 Aziom. Genotyping, quality control, and imputation procedures have been previously

80 described (16). A total of 488,232 participants in the UK Biobank were genotyped. In total,

81 337,409 unrelated samples of European ancestry were then filtered and those with an

82 incomplete diagnosis of asthma were excluded, leaving 313,816 for analysis (302,686 for

83 moderate/severe asthma).

84 We derived a genetic risk score (GRS) for asthma and moderate/severe asthma using 24

85 GWAS SNPs previously reported by Shrine et al. 2019 (2) for each individual participant. The

86 GRS was generated using PLINK by summing the number of risk (asthma-increasing) alleles,

87 which were weighted by the respective allelic effect size (β-coefficient) from the discovery

88 GWAS. For variants not available in UK Biobank, we used the corresponding proxy SNP as

89 indicated in Table 2 within (2). Scaling of the individual GRS was performed to allow

90 interpretation of the effects as a per-1 risk allele increase in the GRS (division by twice the

Supplemental material

BMJ Publishing Group Limited (BMJ) disclaims all liability and responsibility arising from any reliance placed on this supplemental material which has been supplied by the author(s)

Thorax

91   sum of the β-coefficients and multiplication by twice the square of the SNP count

92   representing the maximum number of risk alleles). Analysis of GRS was performed by

93   subdividing into quartiles, as well as the impact per-1 risk allele. Analysis of the shift work

94   effect on asthma was performed on all GRS quartiles. The interaction between GRS quartiles

95   and shift work schedule was tested and a P value for interaction was computed.

96   When investigating continuous variables (lifetime duration and frequency of shift work

97   including nights (**Figure 3**), and odds by genetic risk score (**Supplementary Tables 6 and 7**) p-

98   values for the linear trend were obtained by considering the variable as continuous and

99   running a Wald test to calculate the significance of the variable in our models.

100   To analyse the effect of GRS and chronotype on the relationship of current job shift

101   schedule on asthma risk we compared models with and without an interaction term

102   (between job shift schedule and GRS/chronotype). The two models were compared using a

103   likelihood ratio test and a p-value indicating the significance of the interaction computed.

Total sample size	211,283	21,787	16,225	6,352
Model 1: Age and Sex adjusted OR (95% CI)	1 (referent)	1.12 (1.01-1.24)	1.02 (0.90-1.15)	1.15 (0.96-1.39)
Model 2: Multivariable adjusted OR (95% CI)	1 (referent)	1.15 (0.96-1.39)	1.13 (0.90-1.40)	1.35 (1.01-1.82)
Model 3: Model 2 covariates + Sleep Duration (95% CI)	1 (referent)	1.15 (0.96-1.38)	1.12 (0.90-1.39)	1.33 (0.99-1.79)

Model 2 covariates: age, sex, smoking status, smoking pack years, alcohol status, daily alcohol
intake, ethnicity, Townsend deprivation index, days exercised (walked, moderate and vigorous),
BMI, chronotype, length of working week, job asthma risk and job medical required. Model 3
data are adjusted for Model 2 covariates plus sleep duration.

275

Supplementary Table 9: Adjusted odds (95% CI) of any asthma by current shift work exposure after excluding participants with doctor diagnosed Chronic Obstructive Pulmonary Disease (COPD), emphysema or chronic bronchitis (N = 264,884)

	Current work schedule			
	Day workers	Shift work, but never or rarely night shifts	Irregular shift work including nights	Permanent night shift work
Total cases (% of total sample size)	11,290 (5.16%)	1,247 (5.51%)	823 (4.90%)	349 (5.30%)
Total sample size	218,905	22,616	16,781	6,582
Model 1: Age and Sex adjusted OR (95% CI)	1 (referent)	1.07 (1.01-1.14)	0.96 (0.89-1.03)	1.04 (0.93-1.16)
Model 2: Multivariable adjusted OR (95% CI)	1 (referent)	1.04 (0.93-1.16)	1.05 (0.92-1.19)	1.26 (1.05-1.50)
Model 3: Model 2 covariates + Sleep Duration (95% CI)	1 (referent)	1.04 (0.93-1.16)	1.04 (0.91-1.18)	1.23 (1.03-1.48)

Model 2 covariates: age, sex, smoking status, smoking pack years, alcohol status, daily alcohol intake, ethnicity, Townsend deprivation index, days exercised (walked, moderate and vigorous), BMI, chronotype, length of working week, job asthma risk and job medical required. Model 3 data are adjusted for Model 2 covariates plus sleep duration.
